

Project Report

SMART AGRICULTURE SYSTEM

BASED ON IOT

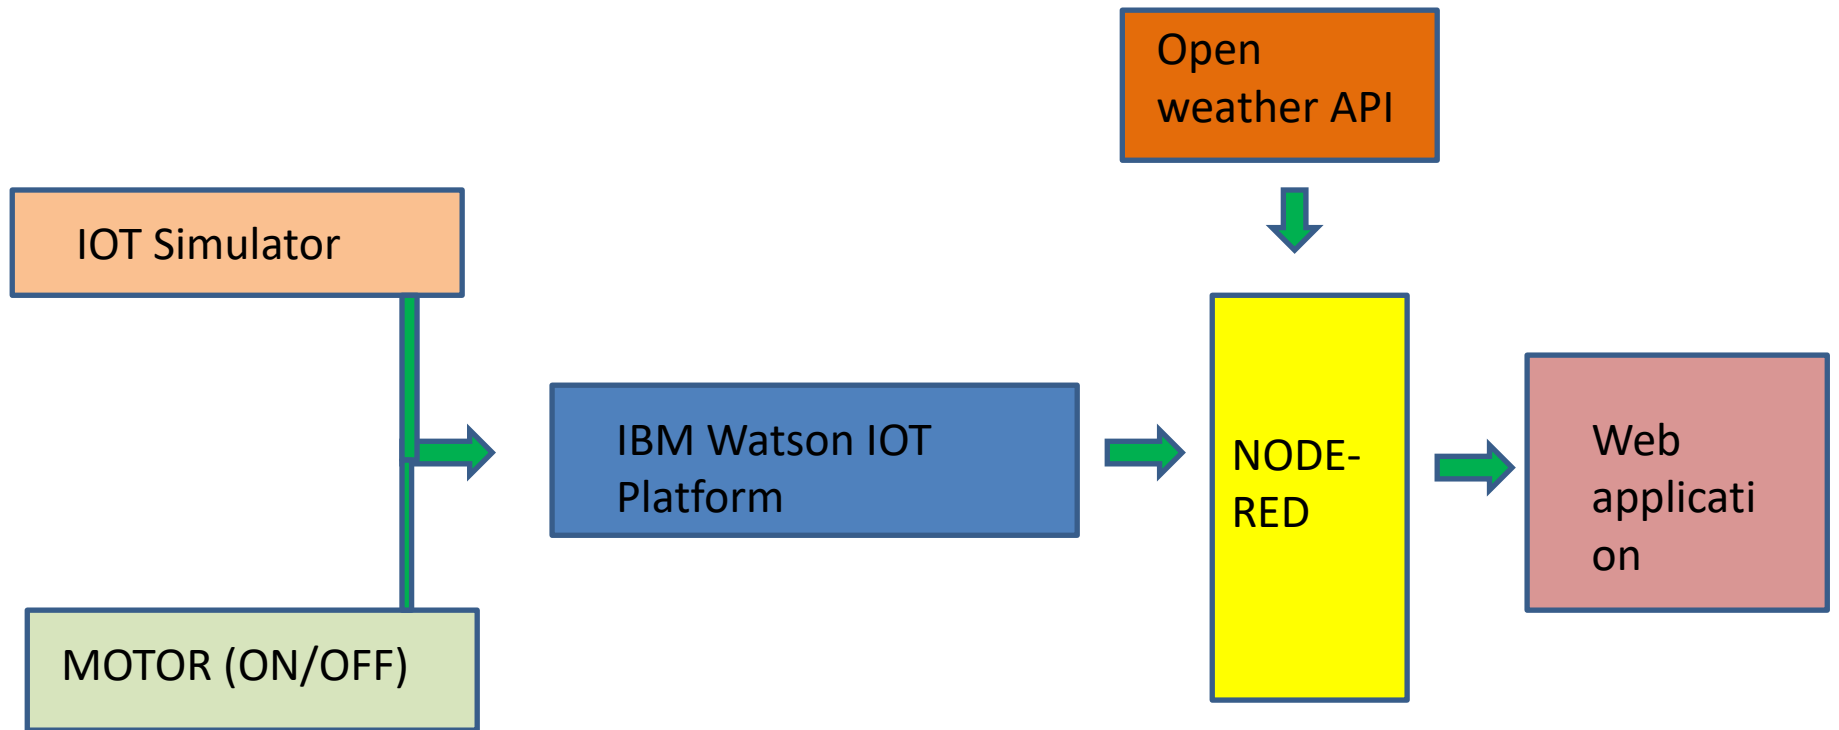

Introduction

The project aims to build a Smart Agriculture System based on IoT that can monitor soil moisture and climatic conditions to grow and yield a good crop. The farmer can also get the realtime weather forecasting data by using external platforms like Open Weather API. Farmer is provided a mobile app using which he can monitor the temperature, humidity and soil moisture parameters along with weather forecasting details.

Based on all the parameters he can water his crop by controlling the motors using the mobile application. Even if the farmer is not present near his crop he can water his crop by controlling the motors using the mobile application from anywhere. Here we are using the Online IoT simulator for getting the Temperature, Humidity and Soil Moisture values.

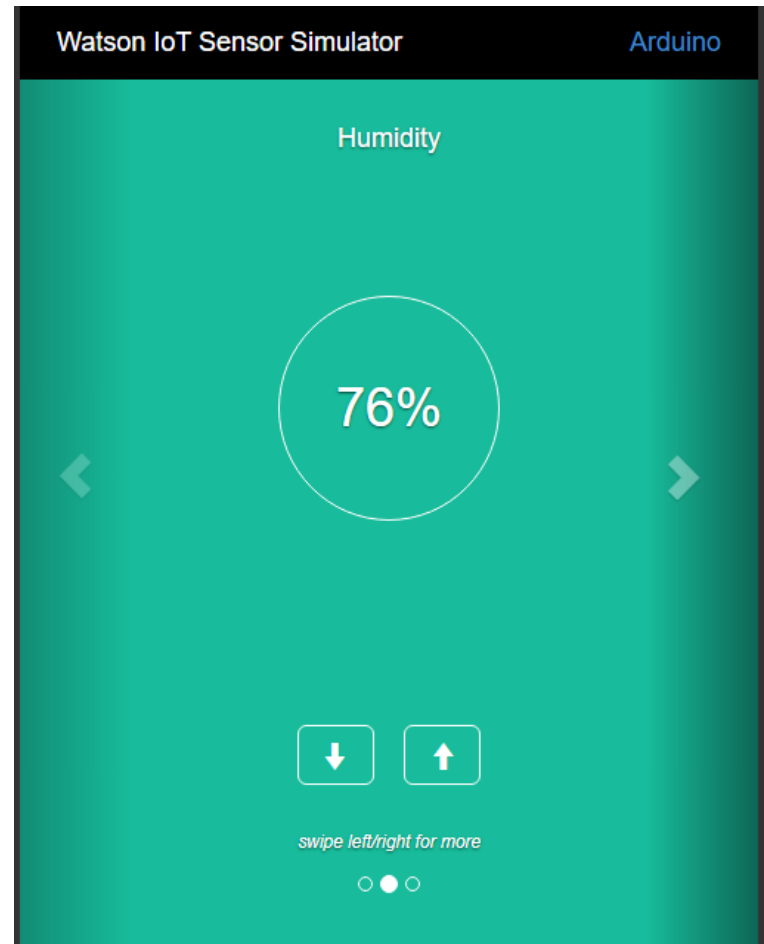

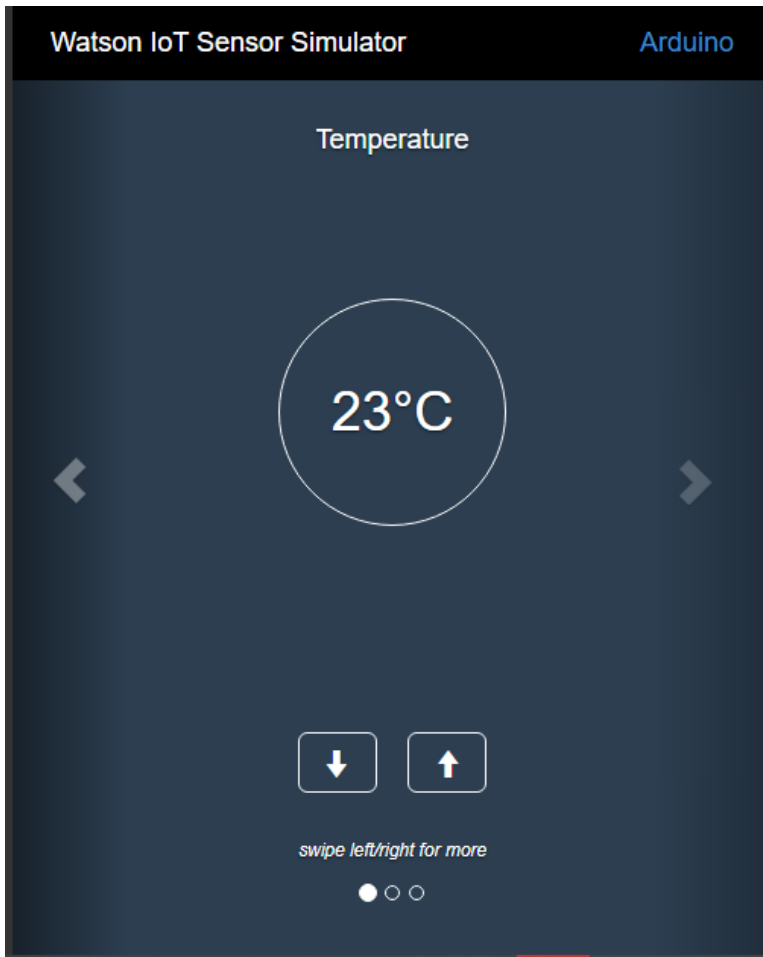

Project Requirements

- ❖ IBM Cloud account
- ❖ Nodered installed locally
- ❖ Python IDLE
- ❖ Python coding
- ❖ IOT Simulator
- ❖ Open weather API
- ❖ Github account

Building Of The Project

- For this project to be working we require:
 - 1)Data from sensors(temperature, humidity, soil moisture etc)
 - 2)Present weather conditions.
- The data of sensors we generated using IBM IOT sensor simulator.
- The present weather data we got from Open weather API.

Object Temperature

26°C

Historical weather for any location

Our new technology, Time Machine, has allowed us to enhance the data in the [Historical Weather Collection](#).

- Historical weather data available for **ANY** coordinate
- The depth of historical data have been extended to **40 YEARS**

You can download data from [Personal account](#) or [contact us](#) to order it. The price is highly competitive - only **10\$** per location!

[Learn more](#)[Go to purchase](#)

Dashboard and Agro API

[Agro API](#) allows getting satellite imagery, weather data and other agricultural services that are based on geodata. [Dashboard](#) is a visual service for working with satellite imagery and weather

```
{ "coord": { "lon": 77.23, "lat": 28.61 }, "weather": [ { "id": 721, "main": "Haze", "description": "haze", "icon": "50d" } ], "base": "stations", "main": { "temp": 309.15, "feels_like": 310.64, "temp_min": 309.15, "temp_max": 309.15, "pressure": 1001, "humidity": 41, "visibility": 4000, "wind": { "speed": 3.6, "deg": 270 }, "clouds": { "all": 0 }, "dt": 1592196668, "sys": { "type": 1, "id": 9165, "country": "IN", "sunrise": 1592178780, "sunset": 1592229017, "timezone": 19800, "id": 1261481, "name": "New Delhi", "cod": 200 }
```

- For this we made an account on IBM Cloud.
- Created two devices.
- Connected them by entering the credentials at IOT sensor simulator.
- For weather forecasting data we created an account on Open weather API.

Web Application UI

- The web application UI was created using Node-RED.
- Node-RED is a programming tool for wiring together hardware devices, APIs and online services in new and interesting ways. It provides a browser-based editor that makes it easy to wire together flows using the wide range of nodes in the palette that can be deployed to its runtime in a single-click.

Advantages & Future Scope

- It will make the work of farmers easy and convenient as well as
- It will increase the probability of the healthy crop.
- It will reduce the labor work.
- Farmers no more need to go to fields to check the parameters and operate the motors as they will be able to receive the data and operate while sitting home through web app.

Conclusion

The IOT based smart agriculture system has high efficiency and accuracy in procuring live data of humidity, temperature, soil moisture. The report generated from this will be of great assistance to farmers and largely to the whole food production and related industries
